

**Chapter 8- Quadrilaterals**  
**Exercise 8.1**

**Question 1:** The angles of a quadrilateral are in the ratio 3: 5: 9: 13. Find all the angles of the quadrilateral.

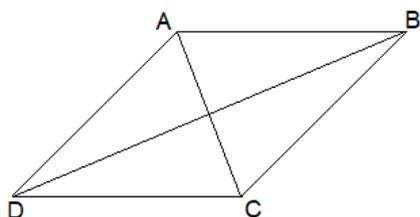

Answer: Let the angles of the quadrilateral be  $3x$ ,  $5x$ ,  $9x$  and  $13x$ .  
therefore,  $3x + 5x + 9x + 13x = 360^\circ$  [as we know angle sum property of a quadrilateral]  
or,  $30x = 360^\circ$   
or,  $x = \frac{360^\circ}{30} = 12^\circ$

thus,  $3x = 3 \times 12^\circ = 36^\circ$   
 $5x = 5 \times 12^\circ = 60^\circ$   
 $9x = 9 \times 12^\circ = 108^\circ$   
 $13x = 13 \times 12^\circ = 156^\circ$

Hence, the required angles of the quadrilateral are  $36^\circ$ ,  $60^\circ$ ,  $108^\circ$  and  $156^\circ$ .

**Question 2:** If the diagonals of a parallelogram are equal, then show that it is a rectangle.

Answer: Let ABCD is a parallelogram and  $AC = BD$ .

In  $\triangle ABC$  and  $\triangle DCB$ ,  
 $AC = DB$  [Given]  
 $AB = DC$  [Opposite sides of a parallelogram]  
 $BC = CB$  [Common]

therefore,  $\triangle ABC \cong \triangle DCB$  [By SSS congruency]  
or,  $\angle ABC = \angle DCB$  [By C.P.C.T.] .....(1)

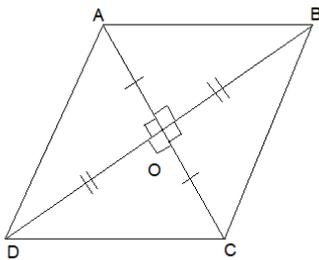

Now,  $AB \parallel DC$  and  $BC$  is a transversal. [ As we know that, ABCD is a parallelogram]  
therefore,  $\angle ABC + \angle DCB = 180^\circ$  .....(2) [Co-interior angles]

Now from (1) and (2), we have  
 $\angle ABC = \angle DCB = 90^\circ$   
i.e., ABCD is a parallelogram having an angle equal to  $90^\circ$ .

Hence, ABCD is a rectangle.

**Question 3: Show that if the diagonals of a quadrilateral bisect each other at right angles, then it is a rhombus.**

Answer: Let ABCD be a quadrilateral such that the diagonals AC and BD bisect each other at O making a right angle.

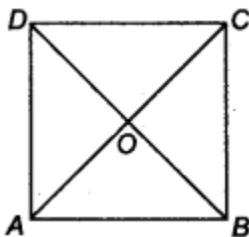

therefore, In  $\triangle AOB$  and  $\triangle AOD$ , we have  
 $AO = AO$  [Common]  
 $OB = OD$  [O is the mid-point of BD]  
 $\angle AOB = \angle AOD$  [Each  $90^\circ$ ]

therefore,  $\triangle AOB \cong \triangle AOD$  [By, SAS congruency]  
hence,  $AB = AD$  [By C.P.C.T.] .....(1)  
Similarly,  $AB = BC$  .....(2)  
 $BC = CD$  .....(3)  
 $CD = DA$  .....(4)  
therefore, From (1), (2), (3) and (4), we have  
 $AB = BC = CD = DA$   
Thus, the quadrilateral ABCD is a rhombus.

**Question 4: Show that the diagonals of a square are equal and bisect each other at right angles.**

Answer: Let ABCD be a square such that its diagonals AC and BD intersect at O.

i) To prove that the diagonals are equal.  
Therefore, we need to prove  $AC = BD$ .  
In  $\triangle ABC$  and  $\triangle BAD$ , we have  
 $AB = BA$  [Common]  
 $BC = AD$  [Sides of a square ABCD]

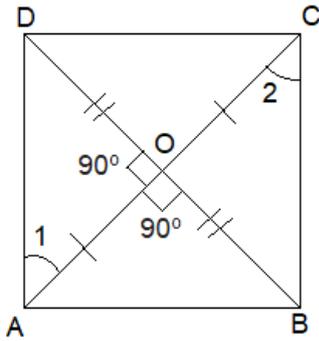

$\angle ABC = \angle BAD$  [Each angle is  $90^\circ$ ]  
 hence,  $\triangle ABC \cong \triangle BAD$  [By SAS congruency]  
 $AC = BD$  [By C.P.C.T.] .....(1)

(ii) To prove diagonals bisect each other.  
 $AD \parallel BC$  and  $AC$  is a transversal. [ $\because$  A square is a parallelogram]  
 therefore,  $\angle 1 = \angle 3$   
 [Alternate interior angles are equal]  
 Similarly,  $\angle 2 = \angle 4$   
 Now, in  $\triangle OAD$  and  $\triangle OCB$ , we have  
 $AD = CB$  [Sides of a square ABCD]  
 $\angle 1 = \angle 3$  [Proved]  
 $\angle 2 = \angle 4$  [Proved]  
 therefore,  $\triangle OAD \cong \triangle OCB$  [By ASA congruency]  
 $\Rightarrow OA = OC$  and  $OD = OB$  [By C.P.C.T.]  
 i.e., the diagonals  $AC$  and  $BD$  bisect each other at  $O$ .....(2)

(iii) To prove diagonals bisect each other at  $90^\circ$ .  
 In  $\triangle OBA$  and  $\triangle ODA$ , we have  
 $OB = OD$  [Proved]  
 $BA = DA$  [Sides of a square ABCD]  
 $OA = OA$  [Common]  
 therefore,  $\triangle OBA \cong \triangle ODA$  [By SSS congruency]  
 or,  $\angle AOB = \angle AOD$  [By C.P.C.T.] .....(3)  
 As we know that,  $\angle AOB$  and  $\angle AOD$  form a linear pair  
 hence,  $\angle AOB + \angle AOD = 180^\circ$   
 therefore,  $\angle AOB = \angle AOD = 90^\circ$  [By(3)]  
 or,  $AC \perp BD$  .....(4)  
 From (1), (2) and (4), we get  $AC$  and  $BD$  are equal and bisect each other at right angles.

**Question 5: Show that if the diagonals of a quadrilateral are equal and bisect each other at right angles, then it is a square.**

Answer: Let ABCD be a quadrilateral such that diagonals AC and BD are equal and bisect each other at right angles.

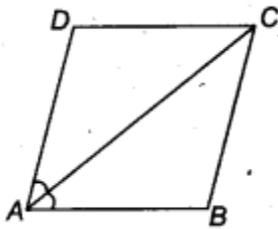

In  $\triangle AOD$  and  $\triangle AOB$ , we have  
 $\angle AOD = \angle AOB$  [Each  $90^\circ$ ]  
 $AO = AO$  [Common]  
 $OD = OB$  [As, O is the midpoint of BD]  
therefore,  $\triangle AOD \cong \triangle AOB$  [By SAS congruency]  
or,  $AD = AB$  [By C.P.C.....(1)]  
Similarly, we have  
 $AB = BC$  ..... (2)  
 $BC = CD$  .....(3)  
 $CD = DA$  .....(4)  
From (1), (2), (3) and (4), we have  
 $AB = BC = CD = DA$   
Therefore, all sides of the Quadrilateral ABCD are equal.

In  $\triangle AOD$  and  $\triangle COB$ , we have  
 $AO = CO$  [Given]  
 $OD = OB$  [Given]  
 $\angle AOD = \angle COB$  [Vertically opposite angles]  
So,  $\triangle AOD \cong \triangle COB$  [By SAS congruency]  
therefore,  $\angle 1 = \angle 2$  [By C.P.C.T.]  
But, they form a pair of alternate interior angles.  
hence,  $AD \parallel BC$   
Similarly,  $AB \parallel DC$   
Therefore, ABCD is a parallelogram.  
As we know that, Parallelogram having all its sides equal is a rhombus.  
Therefore, ABCD is a rhombus.

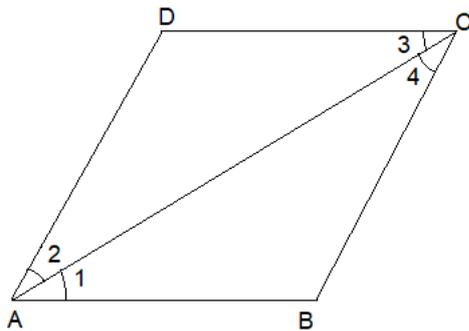

Now, in  $\triangle ABC$  and  $\triangle BAD$ , we have  
 $AC = BD$  [Given]  
 $BC = AD$  [Proved]  
 $AB = BA$  [Common]  
therefore,  $\triangle ABC \cong \triangle BAD$  [By SSS congruency]  
hence,  $\angle ABC = \angle BAD$  [By C.P.C.T.] .....(5)  
Since  $AD \parallel BC$  and  $AB$  is a transversal.  
thus,  $\angle ABC + \angle BAD = 180^\circ$  .....(6) [ Co – interior angles]  
or,  $\angle ABC = \angle BAD = 90^\circ$  [By(5) & (6)]  
So, rhombus ABCD is having one angle equal to  $90^\circ$ .  
Thus, ABCD is a square.

**Question 6: Diagonal AC of a parallelogram ABCD bisects  $\angle A$  (see figure). Show that (i) it bisects  $\angle C$  also,**

(ii) ABCD is a rhombus.

Answer:

We have a parallelogram ABCD whose diagonal AC bisects  $\angle A$   
hence,  $\angle DAC = \angle BAC$

(i) Since, ABCD is a parallelogram.

Therefore,  $AB \parallel DC$  and AC is a transversal.

and  $\angle 1 = \angle 3$  .....(1) [Alternate interior angles are equal]

Also,  $BC \parallel AD$  and AC is a transversal.

and  $\angle 2 = \angle 4$  .....(2) [Alternate interior angles are equal]

Also,  $\angle 1 = \angle 2$  .....(3) [ since AC bisects  $\angle A$ ]

From (1), (2) and (3), we have

$$\angle 3 = \angle 4$$

Hence, AC bisects  $\angle C$ .

(ii) In  $\triangle ABC$ , we have

$$\angle 1 = \angle 4 \text{ [From (2) and (3)]}$$

or,  $BC = AB$  .....(4) [Sides opposite to equal angles of a  $\triangle$  are equal]

Similarly,  $AD = DC$  .....(5)

But, ABCD is a parallelogram. [Given]

therefore,  $AB = DC$  .....(6)

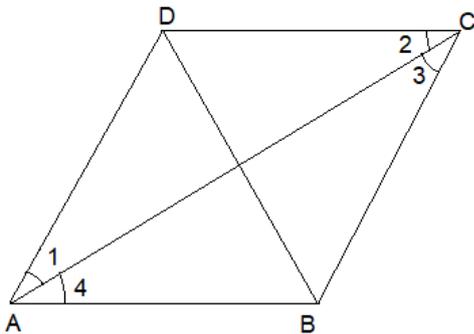

From (4), (5) and (6), we have

$$AB = BC = CD = DA$$

Thus, ABCD is a rhombus.

**Question 7: ABCD is a rhombus. Show that diagonal AC bisects  $\angle A$  as well as  $\angle C$  and diagonal BD bisects  $\angle B$  as well as  $\angle D$ .**

Answer:

The given ABCD is a rhombus therefore,  $AB = BC = CD = DA$  and also,  $AB \parallel CD$  and  $AD \parallel BC$

Now, from the diagram  $CD = AD$  or,  $\angle 1 = \angle 2$  .....(1) [Angles opposite to equal sides of a triangle are equal]

Also,  $AD \parallel BC$  and  $AC$  is the transversal. [Every rhombus is a parallelogram]

or,  $\angle 1 = \angle 3$  .....(2) [Alternate interior angles are equal]

From (1) and (2), we have

$\angle 2 = \angle 3$  .....(3)

Since  $AB \parallel DC$  and  $AC$  is transversal.

therefore,  $\angle 2 = \angle 4$  .....(4) [Alternate interior angles are equal]

From (1) and (4), we have  $\angle 1 = \angle 4$

Therefore,  $AC$  bisects  $\angle C$  as well as  $\angle A$ .

Again,  $AB = CB$  or,  $\angle 3 = \angle 4$  .....(4) [Angles opposite to equal sides of a triangle are equal]

Also,  $AB \parallel DC$  and  $BD$  is the transversal. [Every rhombus is a parallelogram]

or,  $\angle 2 = \angle 4$  .....(5) [Alternate interior angles are equal]

From (4) and (5), we have,

$\angle 1 = \angle 4$  .....(6)

Since  $AD \parallel BC$  and  $BD$  is transversal.

therefore,  $\angle 1 = \angle 3$  .....(7) [Alternate interior angles are equal]

From (4) and (7), we have  $\angle 2 = \angle 3$

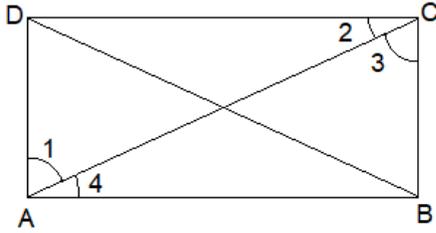

Therefore,  $BD$  bisects  $\angle B$ , as well as  $\angle D$ .

**Question 8: ABCD is a rectangle in which diagonal AC bisects  $\angle A$  as well as  $\angle C$ . Show that**

**(i) ABCD is a square**

**(ii) diagonal BD bisects  $\angle B$  as well as  $\angle D$ .**

Answer:

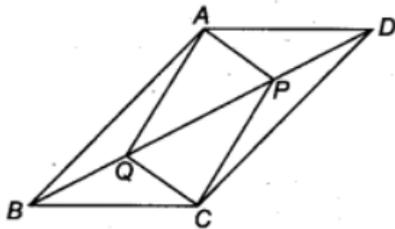

We have a rectangle ABCD such that AC bisects  $\angle A$  as well as  $\angle C$ .  
 i.e.,  $\angle 1 = \angle 4$  and  $\angle 2 = \angle 3$  .....(1)

i) We know that every rectangle is a parallelogram.  
 Therefore, ABCD is a parallelogram.  
 Or,  $AB \parallel CD$  and AC is a transversal.  
 therefore,  $\angle 2 = \angle 4$  .....(2)[Alternate interior angles are equal]  
 From (1) and (2), we have  
 $\angle 3 = \angle 4$   
 In  $\triangle ABC$ ,  $\angle 3 = \angle 4$ , hence,  $AB = BC$  [Sides opposite to equal angles of A are equal]  
 Similarly,  $CD = DA$   
 So, ABCD is a rectangle having adjacent sides equal.  
 Hence, ABCD is a square.

ii) Since ABCD is a square and diagonals of a square bisect the opposite angles.  
 So, BD bisects  $\angle B$  as well as  $\angle D$ .

**Question 9: In parallelogram ABCD, two points P and Q are taken on diagonal BD such that  $DP = BQ$  (see figure). Show that,**

- i)  $\triangle APD \cong \triangle CQB$**
- ii)  $AP = CQ$**
- iii)  $\triangle AQB \cong \triangle CPD$**
- iv)  $AQ = CP$**
- v) APCQ is a parallelogram**

Answer: We have a parallelogram ABCD, BD is the diagonal and points P and Q are such that  $PD = QB$

(i) Since  $AD \parallel BC$  and BD is a transversal.  
 therefore,  $\angle ADB = \angle CBD$  [Alternate interior angles are equal]  
 or,  $\angle ADP = \angle CBQ$   
 Now, in  $\triangle APD$  and  $\triangle CQB$ , we have  
 $AD = CB$  [Opposite sides of a parallelogram ABCD are equal]

$PD = QB$  [Given]  
 $\angle ADP = \angle CBQ$  [Proved]  
 hence,  $\triangle APD \cong \triangle CQB$  [By SAS congruency]

(ii) Since,  $\triangle APD \cong \triangle CQB$  [Proved]  
 or,  $AP = CQ$  [By C.P.C.T.]

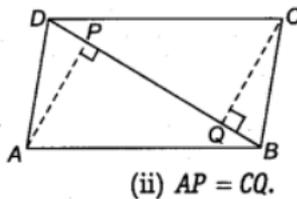

(iii) Since,  $AB \parallel CD$  and  $BD$  is a transversal therefore,  $\angle ABD = \angle CDB$   
 or,  $\angle ABQ = \angle CDP$   
 Now, in  $\triangle AQB$  and  $\triangle CPD$ , we have  
 $QB = PD$  [Given]  
 $\angle ABQ = \angle CDP$  [Proved]  
 $AB = CD$  [ Y Opposite sides of a parallelogram ABCD are equal]  
 hence,  $\triangle AQB \cong \triangle CPD$  [By SAS congruency]

(iv) Since,  $\triangle AQB \cong \triangle CPD$  [Proved]  
 or,  $AQ = CP$  [By C.P.C.T.]

(v) In a quadrilateral  $\triangle PCQ$ ,  
 Opposite sides are equal. [Proved]  
 Or,  $\triangle PCQ$  is a parallelogram.

**Question 10:** ABCD is a parallelogram, and AP and CQ are perpendiculars from vertices A and C on diagonal BD (see figure). Show that

- i)  $\triangle APB \cong \triangle CQD$
- ii)  $AP = CQ$

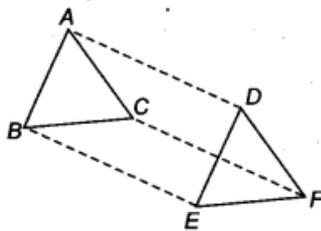

Answer: (i) In  $\triangle APB$  and  $\triangle CQD$ , we have  
 $\angle APB = \angle CQD$  [Each  $90^\circ$ ]  
 $AB = CD$  [Opposite sides of a parallelogram ABCD are equal]  
 $\angle ABP = \angle CDQ$  [Alternate angles are equal as  $AB \parallel CD$  and  $BD$  is a transversal]  
 therefore,  $\triangle APB \cong \triangle CQD$  [By AAS congruency]

(ii) Since,  $\triangle APB \cong \triangle CQD$  [Proved in the previous part (i)]  
 therefore,  $AP = CQ$  [By C.P.C.T.]

**Question 11:** In  $\triangle ABC$  and  $\triangle DEF$ ,  $AB = DE$ ,  $AB \parallel DE$ ,  $BC = EF$  and  $BC \parallel EF$ . Vertices A, B and C are joined to vertices D, E and F, respectively (see figure). Show that

- (i) quadrilateral ABED is a parallelogram
- (ii) quadrilateral BEFC is a parallelogram
- (iii)  $AD \parallel CF$  and  $AD = CF$
- (iv) quadrilateral ACFD is a parallelogram
- (v)  $AC = DF$
- (vi)  $\triangle ABC \cong \triangle DEF$

Answer: i) We have  $AB = DE$  [Given]  
 and  $AB \parallel DE$  [Given]  
 i. e., ABED is a quadrilateral in which a pair of opposite sides (AB and DE) are parallel and of equal length.  
 therefore, ABED is a parallelogram. [proved]

(ii)  $BC = EF$  [Given]  
 and  $BC \parallel EF$  [Given]  
 i.e. BEFC is a quadrilateral in which a pair of opposite sides (BC and EF) are parallel and of equal length.  
 therefore, BEFC is a parallelogram. [proved]

(iii) ABED is a parallelogram [Proved]  
 therefore,  $AD \parallel BE$  and  $AD = BE$  .....(1) [Opposite sides of a parallelogram are equal and parallel] Also, BEFC is a parallelogram. [Proved]

$BE \parallel CF$  and  $BE = CF$  .....(2)[Opposite sides of a parallelogram are equal and parallel]  
 From (1) and (2), we have  
 $AD \parallel CF$  and  $AD = CF$

(iv) Since,  $AD \parallel CF$  and  $AD = CF$  [Proved]  
 i.e., In quadrilateral ACFD, one pair of opposite sides (AD and CF) are parallel and of equal length.  
 Therefore, Quadrilateral ACFD is a parallelogram.

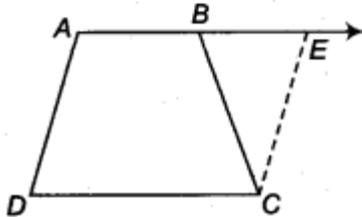

(v) Since, ACFD is a parallelogram. [Proved]  
 So,  $AC = DF$  [Opposite sides of a parallelogram are equal]

(vi) In  $\triangle ABC$  and  $\triangle DEF$ , we have  
 $AB = DE$  [Given]  
 $BC = EF$  [Given]

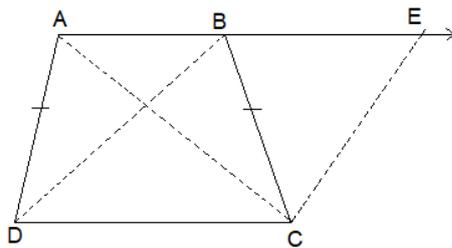

$AC = DE$  [Proved in (v) part]  
 $\triangle ABC \cong \triangle DCF$  [By SSS congruency]

**Question 12:** ABCD is a trapezium in which  $AB \parallel CD$  and  $AD = BC$  (see figure). Show that

- (i)  $\angle A = \angle B$
- (ii)  $\angle C = \angle D$
- (iii)  $\triangle ABC \cong \triangle BAD$
- (iv) diagonal  $AC =$  diagonal  $BD$

Answer: We have given a trapezium ABCD in which  $AB \parallel CD$  and  $AD = BC$ .

(i) Produce AB to E and draw  $CF \parallel AD$  as,  $AB \parallel DC$   
 or,  $AE \parallel DC$  Also  $AD \parallel CF$   
 Or, OECD is a parallelogram.  
 or,  $AD = CE$  .....(1)[Opposite sides of the parallelogram are equal]  
 But  $AD = BC$  .....(2) [Given]  
 By (1) and (2),  $BC = CF$   
 Now, in  $\triangle BCF$ , we have  $BC = CF$   
 $\Rightarrow \angle CEB = \angle CBE$  .....(3)[Angles opposite to equal sides of a triangle are equal]  
 Also,  $\angle ABC + \angle CBE = 180^\circ$  ..... (4) [Linear pair]  
 and  $\angle A + \angle CEB = 180^\circ$  .....(5) [Co-interior angles of a parallelogram ADCE]  
 From (4) and (5), we get  
 $\angle ABC + \angle CBE = \angle A + \angle CEB$   
 OR,  $\angle ABC = \angle A$  [From (3)]  
 OR,  $\angle B = \angle A$  .....(6)

ii)  $AB \parallel CD$  and AD is a transversal.  
 therefore,  $\angle A + \angle D = 180^\circ$  .....(7) [Co-interior angles]  
 Similarly,  $\angle B + \angle C = 180^\circ$  ..... (8)  
 From (7) and (8), we get

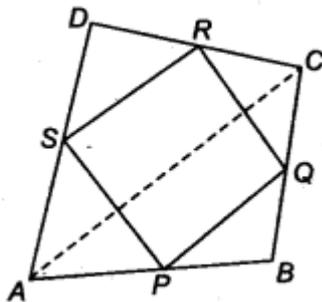

$\angle A + \angle D = \angle B + \angle C$   
 or,  $\angle C = \angle D$  [From (6)]

(iii) In  $\triangle ABC$  and  $\triangle BAD$ , we have  
 $AB = BA$  [Common]  
 $BC = AD$  [Given]  
 $\angle ABC = \angle BAD$  [Proved]  
 or,  $\triangle ABC = \triangle BAD$  [By SAS congruency]

(iv) Since,  $\triangle ABC = \triangle BAD$  [Proved] hence,  $AC = BD$  [By C.P.C.T.]

### Exercise 8.2

**Question 1:** ABCD is a quadrilateral in which P, Q, R and S are mid-points of the sides AB, BC, CD and DA (see figure). AC is a diagonal. Show that  
 (i)  $SR \parallel AC$  and  $SR = \frac{1}{2} AC$   
 (ii)  $PQ = SR$   
 (iii) PQRS is a parallelogram.

Answer: (i) In  $\triangle ACD$ , We have  
 Therefore, S is the mid-point of AD, and R is the mid-point of CD.  
 $SR = \frac{1}{2}AC$  and  $SR \parallel AC$  .....(1)[By mid-point theorem]

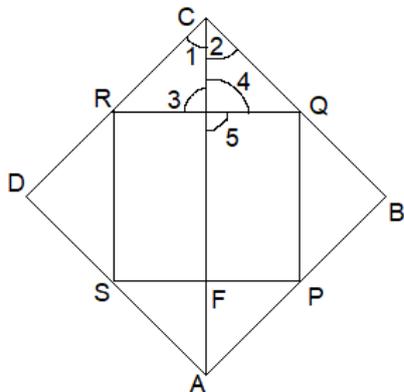

(ii) In  $\triangle ABC$ , P is the mid-point of AB and Q is the mid-point of BC.  
 $PQ = \frac{1}{2}AC$  and  $PQ \parallel AC$  .....(2)[By mid-point theorem]

From (1) and (2), we get  
 $PQ = \frac{1}{2}AC = SR$  and  $PQ \parallel AC \parallel SR$   
 hence,  $PQ = SR$  and  $PQ \parallel SR$

(iii) In a quadrilateral PQRS,  
 $PQ = SR$  and  $PQ \parallel SR$  [Proved]  
 Therefore, PQRS is a parallelogram.

**Question 2: ABCD is a rhombus, and P, Q, R and S are the mid-points of the sides AB, BC, CD and DA, respectively. Show that the quadrilateral PQRS is a rectangle.**

Answer:

We have a rhombus ABCD and P, Q, R and S are the mid-points of the sides AB, BC, CD and DA respectively. For the convenience of the answer, Join AC.

In  $\triangle ABC$ , P and Q are the mid-points of AB and BC respectively.  
therefore,  $PQ = \frac{1}{2}AC$  and  $PQ \parallel AC$  .....(1) [By mid-point theorem]

In  $\triangle ADC$ , R and S are the mid-points of CD and DA respectively.  
therefore,  $SR = \frac{1}{2}AC$  and  $SR \parallel AC$  .....(2) [By mid-point theorem]

From (1) and (2), we get

$$PQ = \frac{1}{2}AC = SR \text{ and } PQ \parallel AC \parallel SR$$

or,  $PQ = SR$  and  $PQ \parallel SR$

hence, PQRS is a parallelogram. ....(3)

Now, in  $\triangle ERC$  and  $\triangle EQC$ ,

$\angle 1 = \angle 2$  [The diagonals of a rhombus bisect the opposite angles]

$$CR = CQ \left[ \frac{CD}{2} = \frac{BC}{2} \right]$$

$CE = CE$  [Common]

Therefore,  $\triangle ERC \cong \triangle EQC$  [By SAS congruency]

or,  $\angle 3 = \angle 4$  ..... (4) [By C.P.C.T.]

But  $\angle 3 + \angle 4 = 180^\circ$  .....(5) [Linear pair]

From (4) and (5), we get  $\angle 3 = \angle 4 = 90^\circ$

Now,  $\angle QRP = 180^\circ - \angle b$  [Y Co-interior angles for  $PQ \parallel AC$  and EQ is transversal]

But  $\angle 5 = \angle 3$  [Vertically opposite angles are equal]

thus,  $\angle 5 = 90^\circ$

So,  $\angle RQP = 180^\circ - \angle 5 = 90^\circ$

So, One angle of parallelogram PQRS is  $90^\circ$ .

Thus, PQRS is a rectangle.

**Question 3: ABCD is a rectangle and P, Q, R and S are mid-points of the sides AB, BC, CD and DA, respectively. Show that the quadrilateral PQRS is a rhombus.**

Answer: We have,

Now, on  $\triangle ABC$ , we have

$$PQ = \frac{1}{2}AC \text{ and } PQ \parallel AC \dots\dots\dots(1) \text{ [By mid-point theorem]}$$

Similarly, in  $\triangle ADC$ , we have

$$SR = \frac{1}{2}AC \text{ and } SR \parallel AC \dots\dots\dots(2)$$

From (1) and (2), we get

$$PQ = SR \text{ and } PQ \parallel SR$$

Therefore, PQRS is a parallelogram.

Now, in  $\triangle PAS$  and  $\triangle PBQ$ , we have

$$\angle A = \angle B \text{ [Each } 90^\circ]$$

$$AP = BP \text{ [P is the mid-point of AB]}$$

$$AS = BQ \text{ [}\frac{1}{2}AD = \frac{1}{2}BC]$$

therefore,  $\triangle PAS \cong \triangle PBQ$  [By SAS congruency]

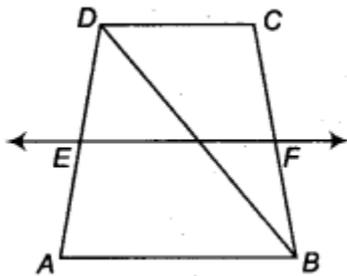

hence,  $PS = PQ$  [By C.P.C.T.]

Also,  $PS = QR$  and  $PQ = SR$  [opposite sides of a parallelogram are equal]

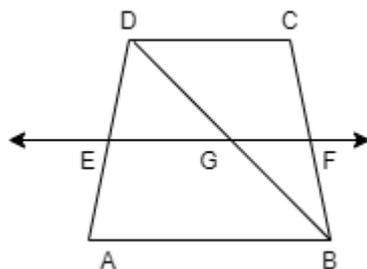

So,  $PQ = QR = RS = SP$ , i.e., PQRS is a parallelogram having all of its sides equal.

Hence, PQRS is a rhombus.

**Question 4:** ABCD is a trapezium in which  $AB \parallel DC$ , BD is a diagonal and E is the mid-point of AD. A line is drawn through E parallel to AB intersecting BC at F (see figure). Show that F is the mid-point of BC.

Answer:

In  $\triangle DAB$ , we know that E is the mid-point of AD

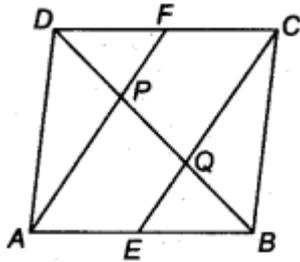

$$EG \parallel AB \text{ [EF } \parallel \text{ AB]}$$

Using the converse of mid-point theorem, we get, G is the mid-point of BD.

Again in  $\triangle BDC$ ,

we have G as the midpoint of BD and  $GF \parallel DC$  [ $AB \parallel DC$ ;  $EF \parallel AB$  and  $GF$  is a part of  $EF$ ]  
 Using the converse of the mid-point theorem, we get, F is the mid-point of BC.

**Question 5: In a parallelogram ABCD, E and F are the mid-points of sides AB and CD respectively (see figure). Show that the line segments AF and EC trisect the diagonal BD.**

Answer: Since the opposite sides of a parallelogram are parallel and equal.

thus,  $AB \parallel DC$

or,  $AE \parallel FC$  .....(1)

and  $AB = DC$

Or,  $\frac{1}{2}AB = \frac{1}{2}DC$

Or,  $AE = FC$  .....(2)

From (1) and (2), we have

$AE \parallel FC$  and  $AE = FC$

Therefore,  $\triangle ECF$  is a parallelogram.

Now, in  $\triangle DQC$ , we have F is the mid-point of DC and  $FP \parallel CQ$  [ $AF \parallel CE$ ]

thus,  $DP = PQ$  .....(3)

[By converse of mid-point theorem]

Similarly, in  $\triangle BAP$ , E is the mid-point of AB and  $EQ \parallel AP$  [ $AF \parallel CE$ ]

thus,  $BQ = PQ$  .....(4) [By converse of mid-point theorem]

therefore, From (3) and (4), we have

$DP = PQ = BQ$

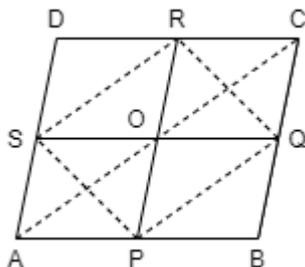

So, the line segments AF and EC trisect the diagonal BD.

**Question 6: Show that the line segments joining the mid-points of the opposite sides of a quadrilateral bisect each other.**

Answer: Let ABCD be a quadrilateral, where P, Q, R and S are the mid-points of the sides AB, BC, CD and DA respectively.

Join PQ, QR, RS and SP.

Let us also join PR, SQ and AC.

In  $\triangle ABC$ , we have P and Q are the mid-points of AB and BC, respectively.  
 thus,  $PQ \parallel AC$  and  $PQ = \frac{1}{2}AC$  .....(1) [By mid-point theorem]  
 Similarly,  $RS \parallel AC$  and  $RS = \frac{1}{2}AC$  .....(2)

thus, By (1) and (2), we get  
 $PQ \parallel RS$ ,  $PQ = RS$

Therefore, PQRS is a parallelogram, and as per rules, the diagonals of a parallelogram bisect each other, i.e., PR and SQ bisect each other. Hence, the line segments joining the midpoints of opposite sides of a quadrilateral ABCD bisect each other.

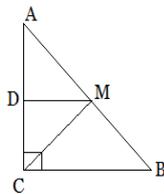

**Question 7: ABC is a triangle right angled at C. A line through the mid-point M of hypotenuse AB and parallel to BC intersects AC at D. Show that**

**(i) D is the mid-point of AC**

**(ii)  $MD \perp AC$**

**(iii)  $CM = MA = \frac{1}{2}AB$**

Answer:

(i) In  $\triangle ACB$ , we have  
 $MD \parallel BC$  [Given]  
 M is the mid-point of AB. [Given]  
 Now, Using the converse of mid-point theorem,  
 D is the mid-point of AC.

(ii) Since  $MD \parallel BC$  and AC is a transversal.  
 $\angle BCA = 90^\circ$  [Given]  
 $\angle MDA = \angle BCA$  [As Corresponding angles are equal]  
 $\angle MDA = 90^\circ$   
 Hence,  $MD \perp AC$ .

(iii) In  $\triangle ADM$  and  $\triangle CDM$ , we have  
 $MD = MD$  [Common]  
 $\angle ADM = \angle CDM$  [Each equal to  $90^\circ$ ]  
 $AD = CD$  [D is the mid-point of AC]  
 therefore,  $\triangle ADM \cong \triangle CDM$  [By SAS congruency]

thus,  $MA = MC$  [By C.P.C.T.] .....(1)

since  $M$  is the mid-point of  $AB$  [Given]

$$MA = \frac{1}{2}AB \text{ .....(2)}$$

From (1) and (2), we have

$$CM = MA = AB$$
